Re: Easy remote computer access solution for small IIABL member agencies

As agencies respond to the coronavirus pandemic and the need for social distancing, many agencies are letting some or all of their employees work from home. But not all agencies have the technology in place to allow employees to access agency computer systems from home.

IIABL has a simple cost-effective solution for small agencies.

Free access to your work computer from home for 30 days. \$10 per month after the 30-day free trial with no contract or obligation.

IIABL is working with Mark Parrish from Monroe, Louisiana. Mark has been involved with the insurance agency business since the late 70's, as well as remote access of systems for 20 years.

Mark has made arrangements with a reliable technology company, hiTech Simplify to provide simple cost-effective remote access. If you aren't setup to control your work desktop from home, Mark Parish will set you up with hiTech Simplify remote access at no cost for 30 days. The cost of the service is \$10 per month after the 30-day free trial with no contract or obligation.

This remote access solution does not involve your server and can provide remote access to one or more of your work computers. You can define which computers have remote access – it does not have to include all of the computers in your office.

Don't stress about having to be in the office or choosing who will and who won't work from home or office. While everyone is rightly concerned about the possibility of overwhelming our health system, many people are not prepared to work from home if we are ordered to shelter in place. This is already happening in various places around the

country. You can get this set up now so you can start a social distance policy immediately.

Features include:

Encrypted link back to the office (secure connection).

All logon and logoff times are recorded and can be reported and audited.

Files stay on the office computer/server, so no files reside on unsecure computers at home.

Remote access is password protected.

Work computers do not have to be logged in to allow remote access.

If you are interested in this remote access solution, please contact Mark Parrish
